# Allocation of Road Repair Costs to Multiple Users of Posted Roads 

Using ESAL method

## Introduction

- Pavement damage depends on weight distribution.
- Weight distribution depends on:
- Number of axles
- Weight on each axle
- Spacing of axles

## ESAL Concept Developed

- AASHTO developed a method to convert various truck axles configurations \& weights to one standard
- Standard = ESAL (Eqquivalent Single $\underline{A x l e}$ Load) One ESAL is equivalent to an $18,000 \mathrm{lb}$ weight on a single axle with dual tires.

# ESALs Determined for Specific Axle Types \& Weights 

- AASHTO developed equivalency factors based on relative damage caused by an axle type \& weight compared to the standard ESAL
- Examples:
- Single axle (18,000 lbs)= 1.0 ESALs
- Single axle ( $12,000 \mathrm{lbs}$ ) $=0.23$ ESALs

- Tandem axle $(24,000 \mathrm{lb})=0.32$ ESALs
- Tandem axle (34,000 lbs)=1.11 ESALs

## ESALs Determined for Specific Trucks

- Most trucks contain a combination of axle types \& loads
, ESALs for entire truck = sum of ESALs for each axle

## Simplified ESAL Determination

- Many DOT's have developed average ESAL factors for each truck class based on measurements of trucks throughout state
- Eliminates need to weigh each truck when doing pavement analysis
- PennDOT's average ESAL Factors provided in Publication 242

# PennDOT’S Truck ESAL Factors (Publication 242) 

TABLE 7.1 Average Initial Truck Factors (ESALs/Truck) by Vehicle Class

| VEHICLE CLASSIFICATION |  |  | ESAL's |  |
| :---: | :---: | :---: | :---: | :---: |
| Line \# in <br> DARWin <br> $\mathbf{3 . 0 1}$ | FHWA <br> Class | Corresponding Department <br> Description | Rigid | Flexible |
| $\mathbf{1}$ | 1 | Motorcycle | $0^{*}$ | $0^{*}$ |
| $\mathbf{2}$ | 2 | Passenger Cars | $0^{*}$ | $0^{*}$ |
| $\mathbf{3}$ | 3 | SUV/Pick-up | $0^{*}$ | $0^{*}$ |
| $\mathbf{4}$ | 4 | BUS Factor | 0.24 | 0.24 |
| $\mathbf{5}$ | 5 | 2-axle, 6-tire | 0.24 | 0.24 |
| $\mathbf{6}$ | 6 | 3-axle, single unit | 1.15 | 0.82 |
| $\mathbf{7}$ | 7 | 4-axle, single unit | 7.00 | 4.50 |
| $\mathbf{8}$ | 8 | 3-axle, single trailer | 0.60 | 0.44 |
| $\mathbf{9}$ | 9 | 3-axle, multiple axle trailer | 1.59 | 1.00 |
| $\mathbf{1 0}$ | 10 | 6-axle, single trailer | 1.42 | 0.75 |
| $\mathbf{1 1}$ | 11 | 5-axle, multiple trailer | 2.40 | 2.33 |
| $\mathbf{1 2}$ | 12 | 6-axle, multiple trailer | 1.42 | 1.28 |
| $\mathbf{1 3}$ | 13 | 7-axle, multiple trailer | 1.42 | 1.28 |

*Note: Because motorcycles, passenger cars, and SUV/Pick-up trucks do not significantly contribute to the 18 -kip ESALs they are considered negligible and an ESAL/truck factor of 0 is assigned. However, the percent of the ADT in this class must be input into DARWin because the Total Percentage must equal $100.00 \%$. If there are any vehicles that are not large enough to be classified in any of the above classes, they should be grouped with the motorcycle percentage.

## Example PennDOT ESAL Factors

Class 7 (Triaxle)

- 4.50 ESALs

Class 9 (Tractor Trailer)

- 1.00 ESALs

## PennDOT Procedure to Allocate Repair Costs to Multiple Users

- Previous Method- Publication 23
- Costs allocated based on \% tonnage hauled by each user
- Revised Method-Recently Developed
- Costs allocated based on \% ESALs by each user
- Spring thaw factor

## Example- ESAL Method

| COMPANY | TRUCK TYPE | NUMBER OF TRUCKS | ESAL FACTOR | ESALS | PERCENT OF ALLOCATION |
| :---: | :---: | :---: | :---: | :---: | :---: |
| A | 4-AXLE SINGLE UNIT | 65 | 4.5 | 292.5 | 67.66\% |
|  | 3 AXLE-MULTIPLE AXLE TRAILER | 36 | 1 | 36 |  |
| B | 3 AXLE-SINGLE UNIT | 55 | 0.82 | 45.1 | 9.29\% |
| C | 5-AXLE MULTIPLE TRAILER | 40 | 2.33 | 93.2 | 23.06\% |
|  | 6-AXLE SINGLE TRAILER | 25 | 0.75 | 18.75 |  |
|  |  |  | TOTAL $=$ | 485.55 | 100.00\% |

## Damage During Spring Thaw

Pavement damage from trucks is accelerated during Spring thaw
PennDOT developed refined procedure to account for additional damage during Spring thaw period

- Independent study of pavement found damage during Spring thaw is approximately 2 times the damage during the rest of the year

# ESAL Method Modified to Account For Spring Thaw Damage 

- ESALs applied during period of Spring thaw multiplied by damage factor to get equivalent ESALs

| COMPANY | HAULING DATA |  |
| :---: | :---: | :---: |
| $\times \mathbf{y y y}$ | NUMBER OF TRUCKS (A) | 28 |
|  | TRUCKS DURING SPRING THAW (B) | 8 |
|  | TRUCKS OUTSIDE SPRING THAW C=(A-B) | 20 |
|  | ESAL FACTOR (D) | 4.5 |
|  | TOTAL EQUIVALENT ESALS (C+(2*B))*D | 162 |
