

EXIT 4

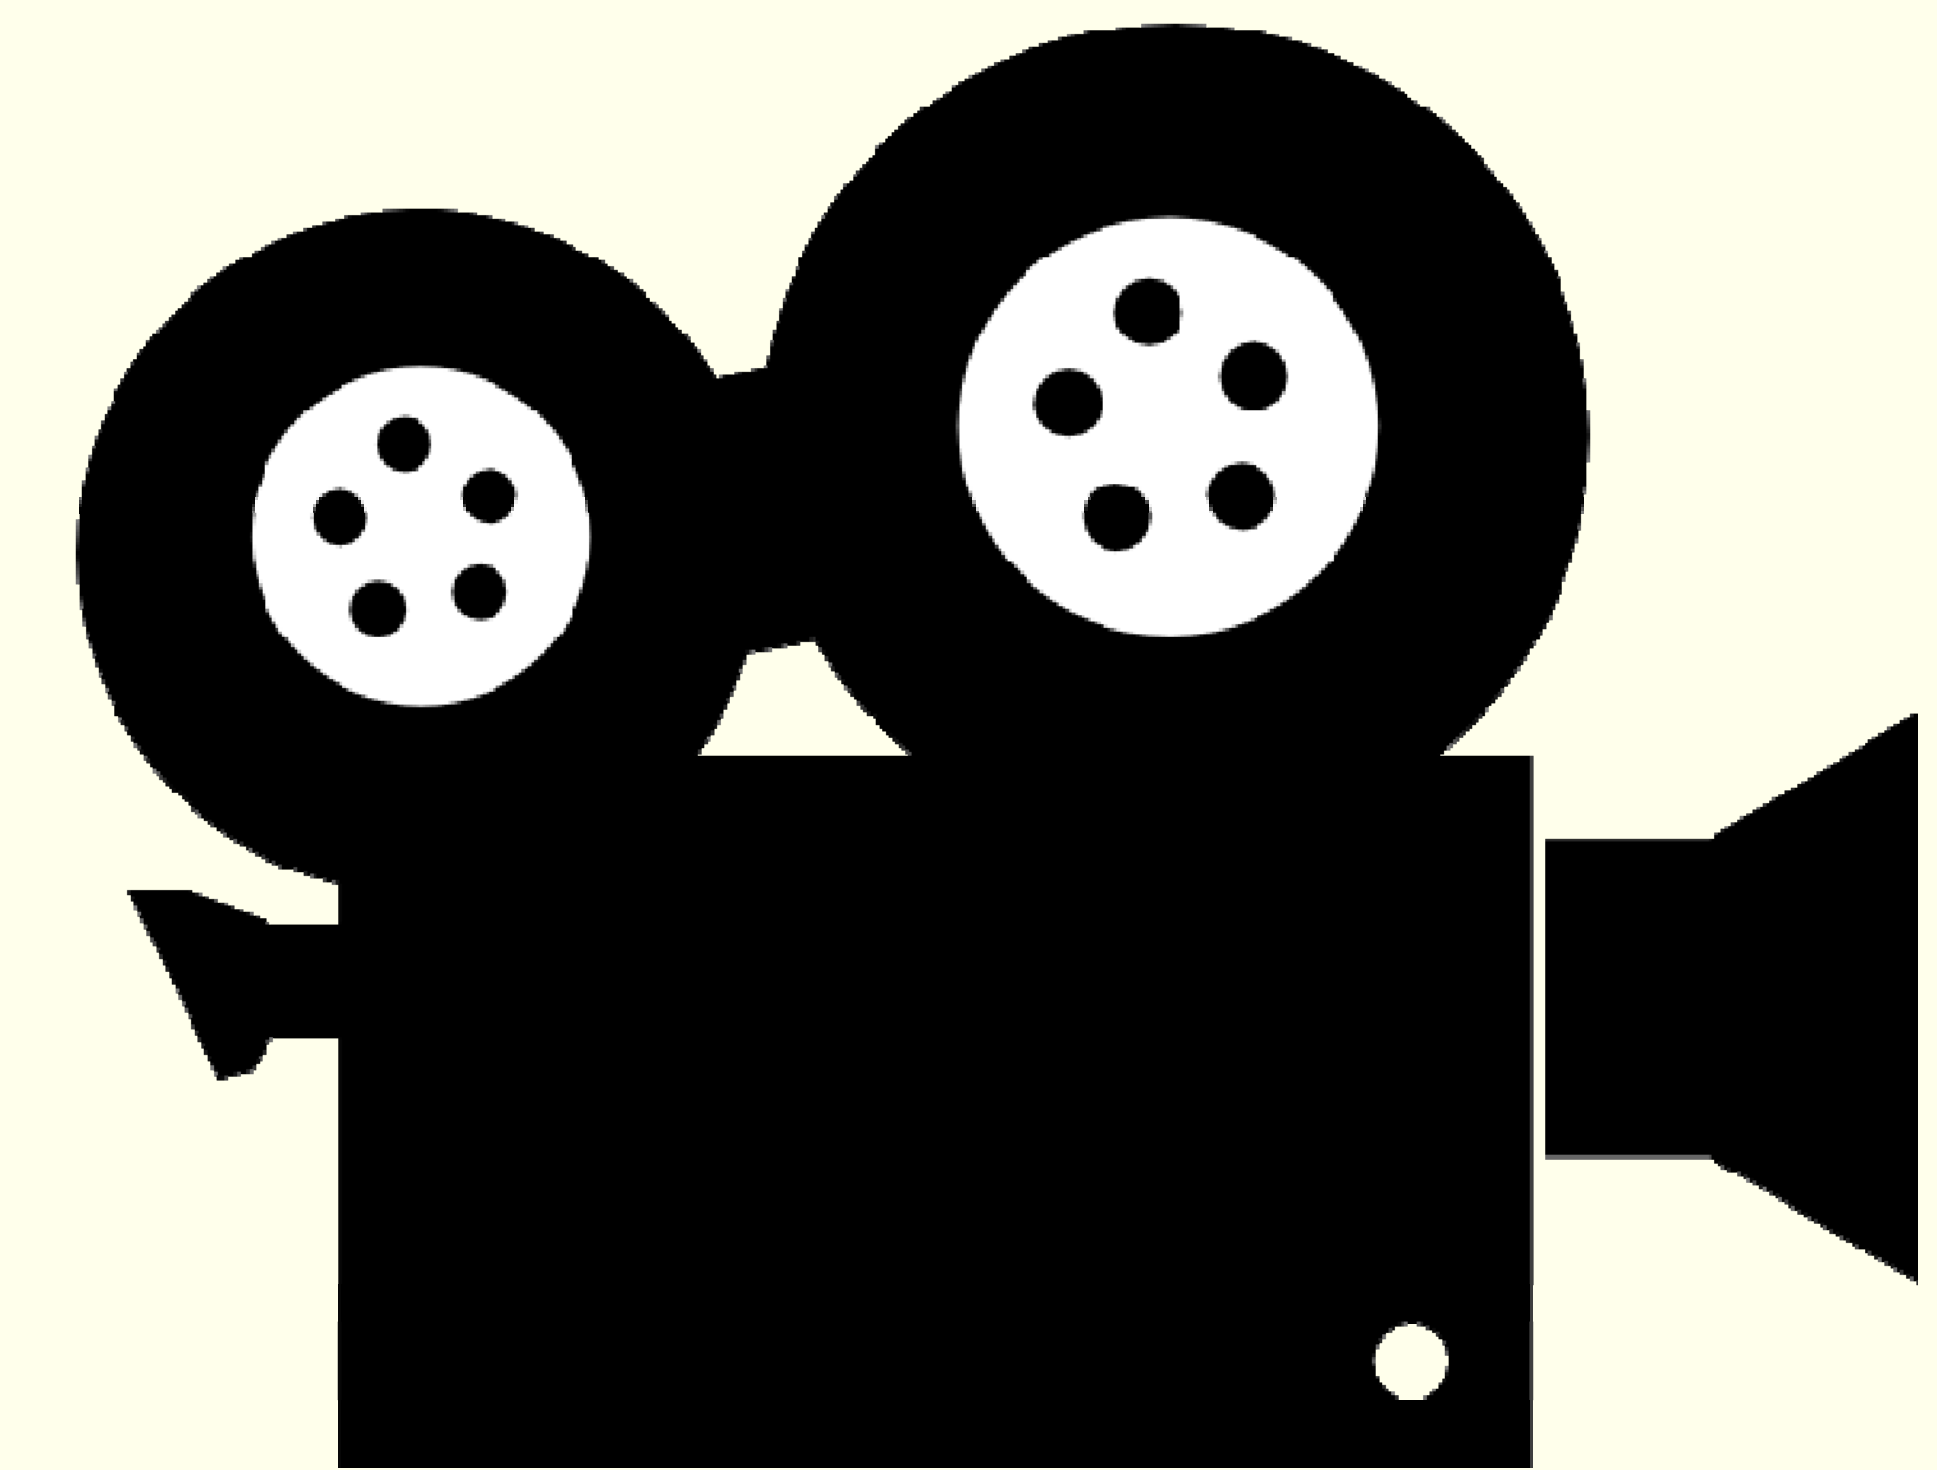

WHAT IS A DIVERGING DIAMOND INTERCHANGE?

A diverging diamond interchange (DDI) is a type of freeway interchange that more efficiently handles heavy left-turn movements, while also reducing traveler conflict points for added safety benefits, in comparison to a traditional diamond interchange.

As of December 2015, 64 diverging diamond interchanges (DDIs) have been opened to traffic in the United States. PennDOT has begun construction of converting an outdated cloverleaf design interchange to its first DDI on I-70 near Washington, PA.

Please take a moment to watch a short simulation video that depicts the operation of a diverging diamond interchange that would be similar to the design being considered for I-83 Exit 4.

After the video, please feel free to review the display boards located on the other side of the room.
