Outline

Introduction to the Standards

Application by Type

- Covered Bridges
- Stone Arch Bridges
- Metal Truss Bridges
- Concrete Arch Bridges

Pennsylvania State Historic Preservation Office
PENNSYLVANIA HISTORICAL AND MUSEUM COMMISSION

pennsylvania
DEPARTMENT OF TRANSPORTATION

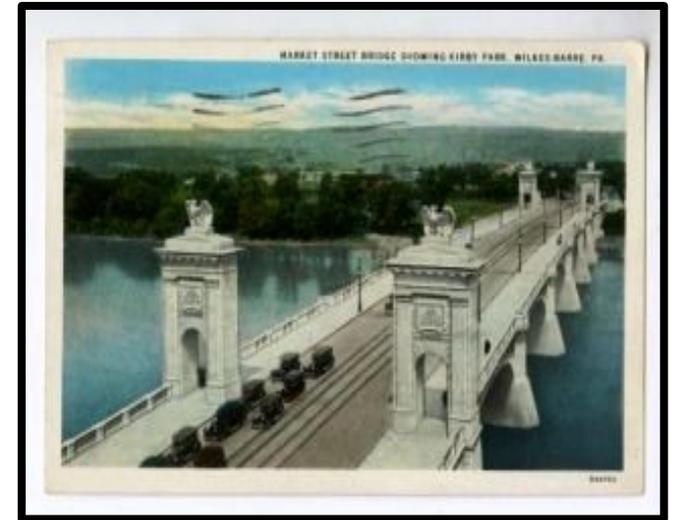

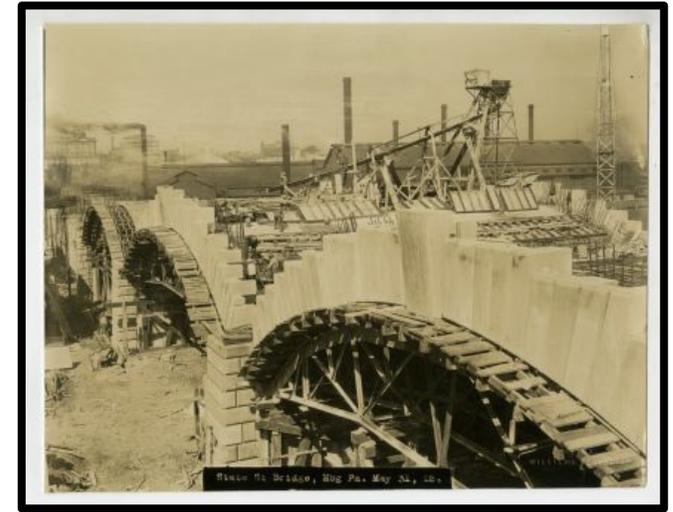

Standards: Section 106 and Section 4(f)

- Can a historic bridge can be rehabilitated in a manner that preserves historic character while meeting purpose and need?
- Avoid or minimize adverse effects under Section 106
- Avoid use under Section 4(f)

Historic Bridge

- National Register eligible or listed
- Engineering or historic significance
- Contributing to historic district
- Statewide Historic Bridge Inventory

Standards Goals

- Preserve historic materials and character
- Identify early
- Consider during maintenance and project planning

Character Defining Features

- Visual (aesthetics) and physical features
- Allow bridge to convey significance
- Includes design features, materials, craftsmanship, connections, and decorative detailing

Secretary of the Interior's Standards

- Administered by National Park Service
www.nps.gov/tps
- Broad concepts
- Preservation, Rehabilitation, Restoration, and Reconstruction

Pennsylvania State Historic Preservation Office
PENNSYLVANIA HISTORICAL AND MUSEUM COMMISSION

pennsylvania
DEPARTMENT OF TRANSPORTATION

Maintenance

Emphasis is on retention and repair of historic materials, features, finishes, spaces, and spatial relationships with more latitude provided for replacement of deteriorated or missing features.

Pennsylvania State Historic Preservation Office
PENNSYLVANIA HISTORICAL AND MUSEUM COMMISSION

pennsylvania
DEPARTMENT OF TRANSPORTATION

Rehabilitation

Acknowledges the need to alter or add to a historic resource to meet continuing or new uses while retaining the property's historic character

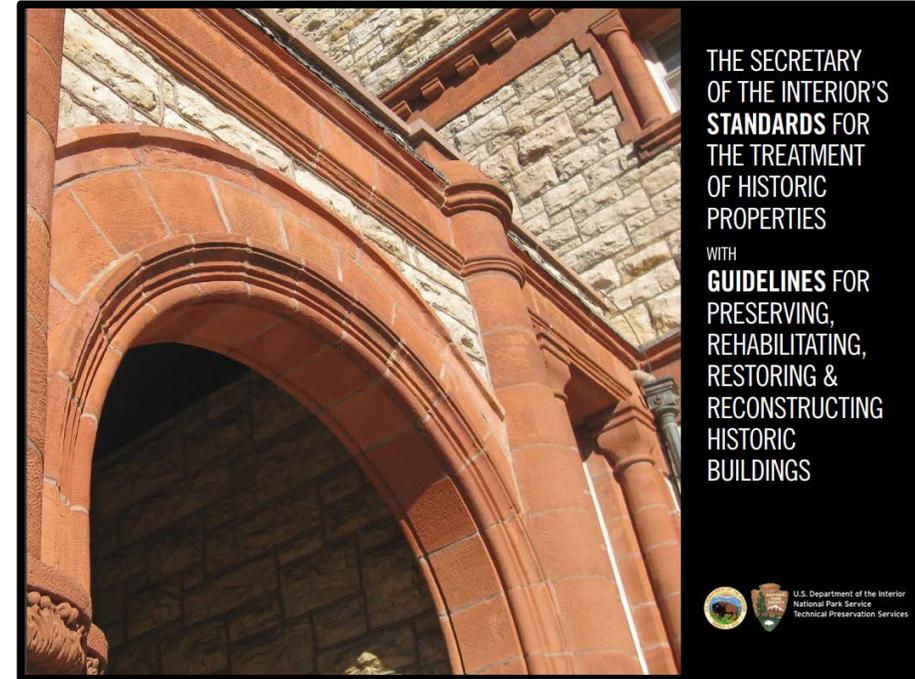

Pennsylvania State Historic Preservation Office
PENNSYLVANIA HISTORICAL AND MUSEUM COMMISSION

pennsylvania
DEPARTMENT OF TRANSPORTATION

Guidelines

- Hierarchy for decision making from least to the greatest level of intervention
- Document existing conditions and justify proposed work

Pennsylvania State Historic Preservation Office
PENNSYLVANIA HISTORICAL AND MUSEUM COMMISSION

pennsylvania
DEPARTMENT OF TRANSPORTATION

1) Identify, Protect and Maintain

- Identify Character Defining Features
 - Use National Register documentation
- Develop Measures for their Protection and Maintenance
 - ***Standard 2: The historic character of a property shall be retained and preserved.***
 - ***Standard 5: Distinctive features, finishes, and construction techniques or examples of craftsmanship that characterize a historic property shall be preserved.***

2) Repair or Replacement In Kind

- Select the least degree of intervention
- Use recognized repair methods
- Limited in kind (same visual appearance) replacement

Standard 6. Deteriorated historic features shall be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature shall match the old in design, color, texture, and other visual qualities and, where possible, materials.

3) Use of Substitute Materials

- Extensive deterioration of feature
- Feature needs to be stronger to accommodate new or continued use
- When there is no source for the original material

Standard 6. Where the severity of deterioration requires replacement of a distinctive feature, the new feature shall match the old in design, color, texture, and other visual qualities and, where possible, materials.

4) Design of Missing Features

- Replicate using documentation
- If no documentation of feature, replacement feature compatible with bridge is acceptable
- Differentiate new work from the old

Standard 6. Replacement of missing features shall be substantiated by documentary, physical, or pictorial evidence.

Standard 9. The new work shall be differentiated from the old and shall be compatible with the massing, size, scale, and architectural features.

Continued Use: Common Issues

Repair and/or Replacement In-Kind of bridge components

Load Issues – Increase carrying capacity

Vertical and/or Horizontal Clearance

Adaptive Re-use

Pennsylvania State Historic Preservation Office
PENNSYLVANIA HISTORICAL AND MUSEUM COMMISSION

DEPARTMENT OF TRANSPORTATION

Covered Bridges

Character-Defining Features

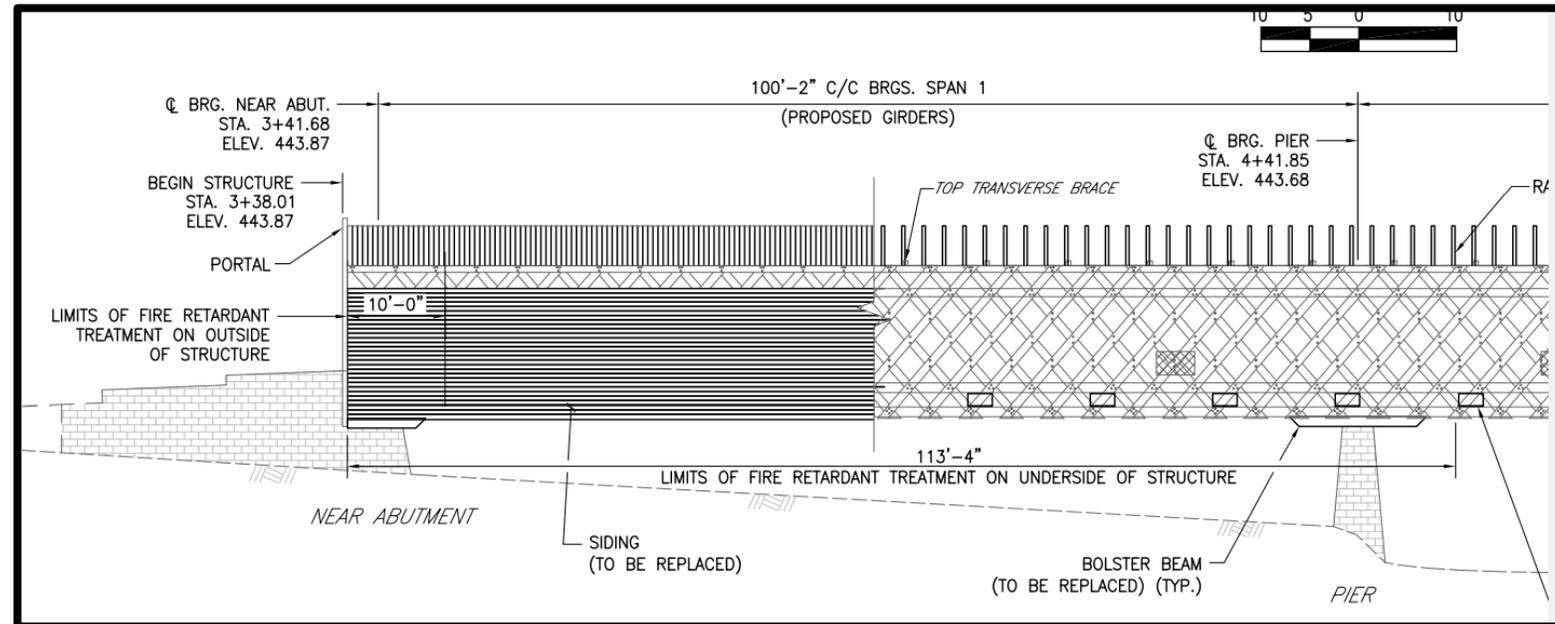

- Heavy Timber Truss
- Floor system
- Overhead bracing
- Connections

Covered Bridges Maintenance

Preventative or Protective Measures: Fire

- Treatment of wood with fire retardant chemicals
- Installation of fire alarms or suppression (sprinkler) systems and video cameras

Covered Bridges Maintenance Collision Damage

On 3/29/2018 Oversized vehicle hit Rapps Dam Road over French Creek in East Pikeland Township.

Bridge on National Register of Historic Places.

Covered Bridges Rehabilitation

Speakman's Bridge Project – No Adverse Effect

Speakman's Covered Bridge` ...

Purpose: To provide a safe and reliable crossing of Buck Run for the public. Many timber members of the structure are deteriorated. The deterioration of the structure was accelerated when the bridge caught fire in 2004. The bridge was closed in 2011 when a tractor trailer collided with it.

Needs:

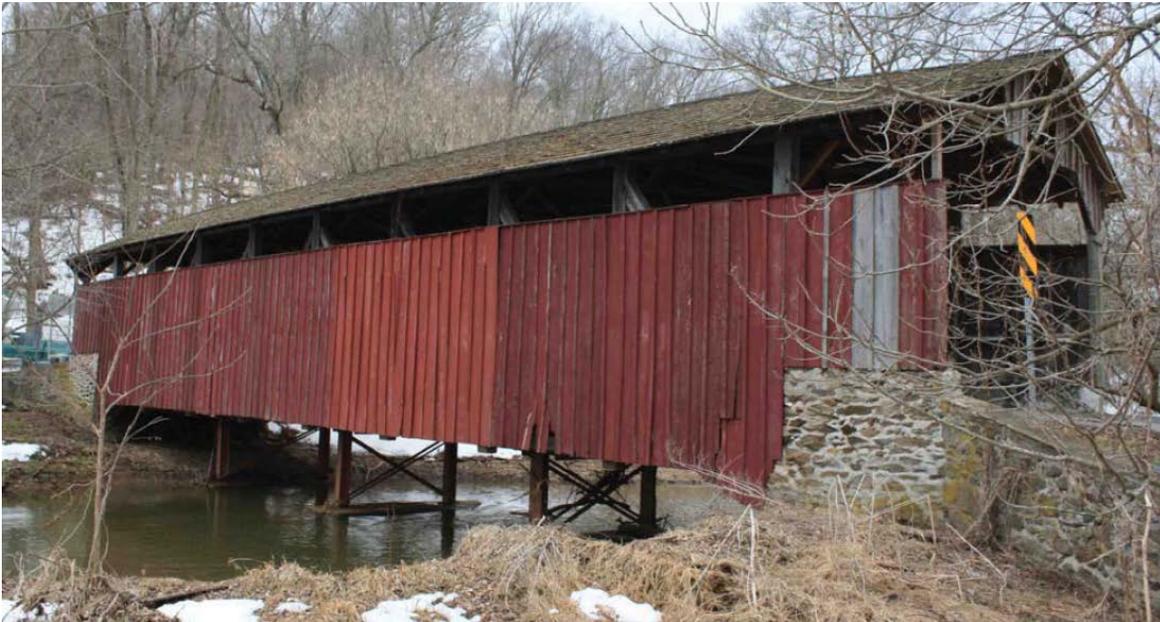

- The bridge is structurally deficient and in need of repair.
- The bridge is unable to handle the modern transportation needs of the surrounding community.

DEPARTMENT OF TRANSPORTATION

Purpose and Need

**Adams Avenue (SR 1002) Bridge over Tacony Creek,
City of Philadelphia, Philadelphia County**

The bridge is structurally deficient due to severe deterioration of the stone masonry. The bridge is in overall “serious” condition due to the loss of mortar, stones, and flattening of the arch structure and has a sufficiency rating of 15.0. The bridge is listed on the National Register of Historic Places. The bridge has a current ADT (Average Daily Traffic) of 16,600 and is open to full legal loading. The purpose of the project is to address the structural deficiencies of the bridge and to provide a safe crossing over Tacony Creek.

Cultural Resources Management Program

Bridge to the Past:

A Management Plan for Pennsylvania's Historic Metal Truss Bridges

Management Summary

Introduction

An important part of the Commonwealth of Pennsylvania's heritage was our leading role in the story of the Industrial Revolution. The modern processes of iron and steel production and fabrication were in part born in the great foundries and works at Pittsburgh, Bethlehem, and other parts of the state. A durable legacy of that heritage of iron and steel, one that every Pennsylvanian is familiar with, is our population of metal truss bridges. These spans of wrought iron and steel date to the late 19th through the mid 20th centuries, and have connected Pennsylvania communities to each other and to the larger transportation network for more than a century. Pennsylvania has, by many accounts, the earliest, most diverse, and most significant population of metal truss bridges in the United States. Generations of Pennsylvanians have heard their tires sing on the metal decks, seen a river or railroad pass below, fished over the railings, or watched the sun descend behind an old truss. Some of these bridges are iconic parts of Pennsylvania's historic communities, and are fondly recalled symbols of many of our hometowns and communities.

These bridges are also components of the state's modern transportation network. For many of them, that has proved to be their undoing. Most were never designed with an anticipation of the volume and size of modern traffic, nor were they designed to last as long as some of them have. Decades of limited maintenance funding have also taken their toll, and many bridges show the signs of their age, and are succumbing to the wear and tear. They also don't conform to modern standards of safety: all of them have *fracture-critical* members. The result has been an accelerating rate of loss through replacement. Since 2001, 44% -141 out of 321 metal truss bridges that were listed in or were determined to be eligible for listing in the National Register of Historic Places (NR) prior to 2016 - have been replaced.

The heritage value of these bridges presents a set of both challenges and opportunities to the Pennsylvania Department of Transportation (PennDOT). As the agency responsible for Pennsylvania's transportation network, PennDOT is required by federal and state law and regulation to both maintain a safe and efficient modern transportation network, and to do what it can to preserve and extend the useful life of our legacy of historic truss bridges. These requirements drove the development of this plan.

Low Cost Bridge Repair

Steel Stringer End Connection

Stringer Support Bracket

PennDOT District 12-0
Westmoreland County
S.R. 993 over Brush Creek
Single span thru truss bridge, stringer ends repaired by installing steel support bracket. Rehabilitation performed to avoid a weight limit posting.

Design: In-House by District Personnel

Construction: Westmoreland County
Maintenance Crew

Duration of Construction: 1 Week (3 man crew)

Maintenance and Protection of Traffic:
Lane closure over each stringer being repaired.
Cost: \$4,000 Material Cost

Stringer Support Bracket

Stringer Support Bracket

Lessons Learned:

(1) Original design would repair deficient stringers at 5 locations and reduce the bridge's effective width. This design did not consider that this would prevent access to the bridge from a private business with a driveway adjacent to the bridge.

(2) Maintenance forces proposed 4 additional locations to avoid reducing the bridge width. Additional expense and time was minimal and provided a reasonable and cost effective solution.

Purpose/Need – Ross Fording Road

Project Purpose:

The purpose of this project is to maintain the safe and effective movement of the public and emergency services.

Project Needs:

Due to a vehicular impact which occurred in July of 2015, the structure is currently closed to traffic. Therefore, the needs for the project are based off of the existing deficiencies present and minimizing future potential for vehicular damage and include the following:

- The upstream truss upper chord is completely fractured
- The upstream truss vertical members are cracked and deformed
- The upstream truss lower chord is deformed
- The existing railing is prone to spread impact to multiple truss members
- Stringers 1 through 5 are deformed
- Based on the condition of the structure it was deemed unsafe for use and is closed

Metal Truss Bridges Rehabilitation

Repair/Replacement of Components

Structure to be rehabilitated in 2018
(ECMS 89340, Section HBS)

Replace timber deck.

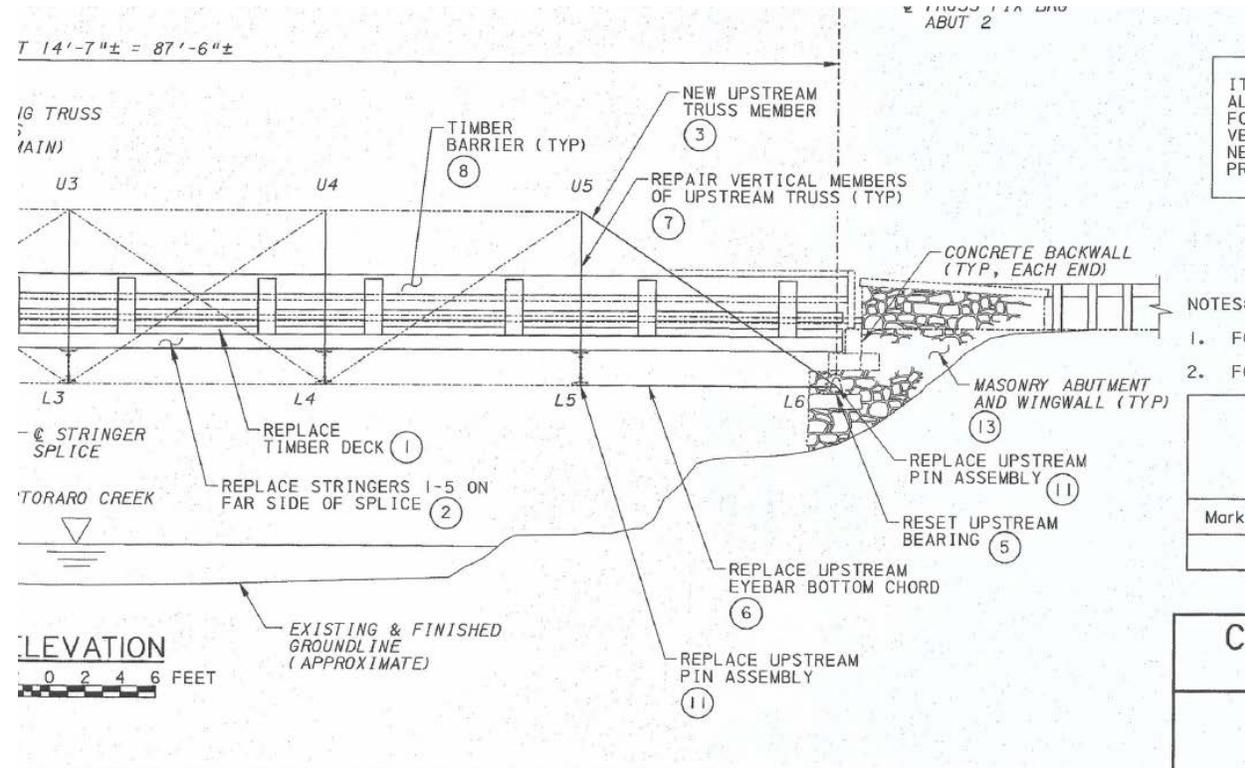

Replace Stringers 1-5.

Replace top chord U5-L6 on upstream truss.

Replace bottom chord L5-L6 on upstream truss.

Reset bearing for upstream truss.

Replace existing timber curb w/timber
barrier.
