

# Cold patch warmer

- The purpose of a cold patch warmer is to efficiently fill pot holes at a manageable temperature. Using this equipment allows the cold patch to be shoveled and properly compacted without having to purchase an expensive hot box trailer. It also allows the purchase of cold patch in bulk, which is less expensive than bagged cold patch.
- The trailer is 3' x5', the box is made from 1/8th inch steel which was designed and welded in house.
- The trailer has a double walled box which creates the heating chamber. When the trailer is filled, the chamber is heated with a simple propane weed burner directed between the two walls.
- The box holding about 1000 lbs of cold mix takes approximately 30-45 minutes to reach 90 degrees.
- The top lids are designed to open like a chute so it can be loaded with a 6' loader bucket.
- There is a coal chute on the back so the cold mix can be shoveled right off the back of the trailer.
- The back of the trailer holds two shovels and one rake to place the cold mix.
- The front of the trailer holds a hand tamper and a plate tamper which is loaded and unloaded with a battery powered hoist.
